Temperature Charts ⁴

Performance data acquired at 22°C ambient, 4°C nominal set point in an empty cabinet with shelves using air probes, during stabilized steady state operation and a DAQ sampling rate of one measurement every 10 seconds

¹ - Uniformity is defined as the maximum variance in temperature across all probes at any point in time over the testing period

² - Stability is defined as the maximum variance in temperature experienced by any single probe over the testing period

³ - Data per Energy Star test results or equivalent testing and calculation. Heat rejection based on daily averages, not continuous operation. Performance exceeds Energy Star requirements

⁴ - Charts serve as representations of the product family, and actual performance may vary slightly
